The Behavioral and Cognitive Neuroscience Program at the Graduate Center, CUNY takes as its domain the neural basis of behavioral and mental processes, from species-typical behavior to cognition. This program brings together faculty from several CUNY campuses to provide interdisciplinary doctoral training across a broad range of research areas within neuroscience. The Program provides both broad and individualized training to a select group of doctoral students. These students will have scholarly and research interactions with a distinguished faculty, utilizing a wide range of research methods at several levels of analysis from single-neuron electrophysiology, through behavioral measurement and control, to procedures for neural imaging during cognitive processes. The curriculum is interdisciplinary, taught by faculty from both Biology and Psychology and will provide a strong, common foundation in molecular, cellular, systems, behavioral and cognitive neuroscience.
