Babies needed for a research study

This study examines brain processing of sound. Results of this study may contribute to the clinical management of infants, children and adults with hearing loss.

Your child may be eligible to participate if he/she:

- Is newborn to 12 months old
- Is typically developing
- Has no history of neurologic or learning problems
- Has normal hearing

Responses to sound will be recorded using small sensors placed on your child’s scalp with gel or saline solution. Sounds will be presented via a loudspeaker at normal conversational speech levels. Your child will watch a video during testing. You will be with your child at all times during this study. Your child must be awake for this study.

The test usually takes one session of approximately 2 hours. You will be paid $80 for your child’s participation and your child will receive a small prize.

If you would like further information about the study, or would like to schedule an appointment to participate, please contact Lisa Goldin:
