

Course Title: Introduction to Algebraic Number Theory

Course #: 87000

Time and Location: Thursdays 2PM-4PM, Graduate Center of CUNY, room 6417

Instructor Name: Victor Kolyvagin

Contact Information: VKolyvagin@gc.cuny.edu

Pre-Requisites: _____

Office Hours: Thursdays, 1PM-2PM

Description:

The main purpose of the course is to study basics of Algebraic Number Theory. In particular, it would provide a ground for further more advanced study.

The central theme will be study of theory of divisibility in rings of algebraic integers (divisor theory) - far-reaching generalization of the main theorem of arithmetic about uniqueness of decomposition in pimes of a natural number.

One of the goals of Algebraic Number Theory is getting applications to solving diophantine equations, it is one of its origins as well.

Historically, Kummer work on Fermat,s equation $x(\text{power } l)+y(\text{power } l)=z(\text{power } l)$ over the cyclotomic field $K(l)$,generated over the rational numbers by l -th roots of unity, was very important for development of the theory.

We wil study arithmetic of cyclotomic fields and Fermat,s equations over them as a motivation for development of theory of algebraic numbers and as a nice example of how it works.

One year of algebra course is recommended for students to attend.

Book to be usefull- Borevich,Shafarevich "Number Theory".
